

Assignment 9: React Job Portal with Material UI and Axios

Objective: In this assignment, you will develop a React-based job portal that allows job seekers to explore job listings and company profiles. The assignment focuses on front-end development, session management, and dynamic content rendering. You will also integrate Material UI (optional) and Axios for API requests. This project will be further improved in the next assignment, so maintaining a well-structured folder hierarchy is essential.

Additionally, you must connect this project with your previous Node.js assignment by implementing a login page using existing credentials (username and password, from assignment 8), no sign-up page is required.

Technical Requirements:

1. Login and Session Management

- Develop a login page using stored usernames and passwords.
- Implement session management using Axios for API requests.
- Include a logout feature to securely end user sessions.

2. Job Portal Pages and Routing:

- Create the following five main pages using React components and react-router:
 - Home
 - About
 - Job Listings
 - Contact
 - Company Showcase (List of Companies)
- Ensure each component follows a separate folder structure for maintainability.
- Utilize Material UI components (or other UI libraries like Bootstrap or CSS) to enhance the UI.
- Implement a well-structured routing system for seamless navigation.

3. Job Listings with Frontend Data:

- Dynamically display job positions on the Job Listings page. Each listing should include:
 - Job Title
 - Required Skills
 - Salary
- Manage job listing data within the frontend (No API request required; use the provided jobPosts object at the end of this document).

4. Company Showcase with Image Gallery:

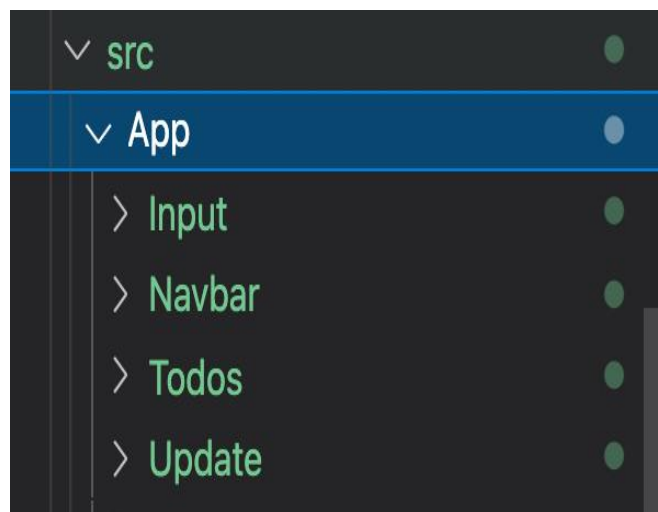

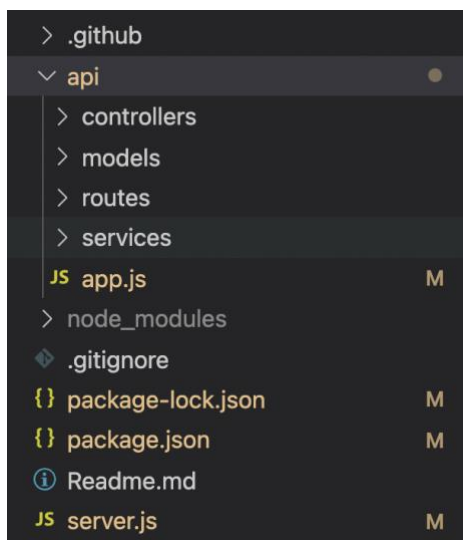

- Develop a Company Showcase page that displays a gallery of company images with their names.
- Images should be fetched from the backend, as implemented in a previous assignment.
- For this assignment, images can be general or user-specific, but in Assignment 10, API restructuring will be required to fetch images based on the user.

5. Material UI Components:

- Integrate Material UI components (optional in this assignment but required in the next).
- Suggested components include:
 - Cards (for displaying job posts and company profiles)
 - Navigation Bars
 - Buttons
 - Forms
- Use React's `map()` function to dynamically render components from the provided job data.

6. Version Control and Documentation:

- Maintain the project in a Git repository.
- Include a `.gitignore` file to exclude non-essential files (e.g., `node_modules`).
- Write a comprehensive `README.md` file, detailing:
 - Project setup
 - Folder structure
 - Navigation
 - Key functionalities

```
1. const jobPosts = [
2.   {
3.     id: 1,
4.     title: "Full Stack Developer",
5.     description:
6.       "Join our dynamic team to work on cutting-edge technologies. Develop and maintain
sophisticated web applications for our diverse client base.",
